

Batch Optimizer

Highlights

- Consistent product
- Simple recipe configuration, organization and storage
- Centralized access for version control
- Reduced PLC memory requirements and enhanced performance and speed

Consistency = Profitability

ESE's customized, cost-effective batching controls help minimize production variances and maximize profits.

Using large-scale enterprise management systems like Rockwell Software's FactoryTalk Batch or ESE's Batch Optimizer strategy, we create the right scaled solutions for your operation.

Flexible Recipe Creation

ESE helps establish all recipe steps or 'Op Codes' for your production process. Many will have setpoints, or 'Operands,' measured in time, amount, flow rate, temperature, level, or other units. Once the codes are programmed, recipe creation can begin.

These Op Codes are placed in order by your recipe management group. The operands are edited and the recipe is saved. At any time, an Op Code can be repositioned within the recipe, removed, or a new op code can be inserted, giving you the flexibility to create infinite combinations of recipes.

When a recipe is selected to run, the phase logic programming advances through each Op Code like a flowchart, satisfying all requirements before proceeding to the next step.

Confidentiality & Security

With ESE's batching controls, you create your own formulations - there's no need to share your proprietary information.

Access to recipes can be controlled, ensuring the highest level of security. You can even monitor who created or modified each recipe.

Once your equipment is onsite, each phase is tested again to verify the correct operation of devices associated with that phase. Once the phases are verified, commissioning is complete and you're ready to create recipes and run batches that minimize production variances and maximize profits.

ESE will remain onsite as needed for additional training, supervision of initial recipe creation, and oversight of the first production batches.

Support

ESE provides training on batching systems so users have confidence to create, modify and control batches.

We're always available for system support, and for helping you modify or add new Op Codes as your process grows and expands.

Smart Startups

Project startup begins with each phase being tested in house to ensure appropriate functionality and interlocking within the PLC program.

ESE: A Strong Partnership with Lasting Results

Partner with ESE and see how we can help you minimize your fixed costs and increase profits by offering the best in process automation and control systems solutions. Contact us to learn more about the advantages of teaming up with ESE and tapping into the knowledge of our engineering experts.

Optimizing the Process.
Maximizing Your Profits.
